

# TA Document 2003017 IIDC 1394-based Digital Camera Specification Ver.1.31

February 12, 2004

## Sponsored by:

1394 Trade Association

#### Accepted for Release by:

1394 Trade Association Board of Directors.

#### Abstract:

The purpose of this document is to act as a design guide for digital camera makers that wish to use IEEE 1394 as the camera-to-PC interconnect. Adherences to the design specifications contained herein do not guarantee, but will promote interoperability for this class of device. The camera registers, fields within those registers, video formats, modes of operation and controls for each are specified. Area has been left for growth. To make application for additional specification, contact the 1394 Trade Association Instrumentation and Industrial Control Working Group, Digital Camera Sub Working Group (1394-TA II-WG IIDC-SWG). IIDC v1.31 is enhanced version of IIDC v1.30 and this can support IEEE 1394,b-2002 compliant high-speed transfer.

#### Keywords:

IIDC, Camera, 1394, Digital Video, Isochronous, Asynchronous

Copyright © 1996-2004 by the 1394 Trade Association. 1111 South Main Street, Suite 100, Grapevine, TX 76051, USA http://www.1394TA.org All rights reserved.

Permission is granted to members of the 1394 Trade Association to reproduce this document for their own use or the use of other 1394 Trade Association members only, provided this notice is included. All other rights reserved. Duplication for sale, or for commercial or for-profit use is strictly prohibited without the prior written consent of the 1394 Trade Association.

**1394 Trade Association Specifications** are developed within Working Groups of the 1394 Trade Association, a non-profit industry association devoted to the promotion of and growth of the market for IEEE 1394-compliant products. Participants in working groups serve voluntarily and without compensation from the Trade Association. Most participants represent member organizations of the 1394 Trade Association. The specifications developed within the working groups represent a consensus of the expertise represented by the participants.

Use of a 1394 Trade Association Specification is wholly voluntary. The existence of a 1394 Trade Association Specification is not meant to imply that there are not other ways to produce, test, measure, purchase, market or provide other goods and services related to the scope of the 1394 Trade Association Specification. Furthermore, the viewpoint expressed at the time a specification is accepted and issued is subject to change brought about through developments in the state of the art and comments received from users of the specification. Users are cautioned to check to determine that they have the latest revision of any 1394 Trade Association.

Comments for revision of 1394 Trade Association Specifications are welcome from any interested party, regardless of membership affiliation with the 1394 Trade Association. Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments.

Interpretations: Occasionally, questions may arise about the meaning of specifications in relationship to specific applications. When the need for interpretations is brought to the attention of the 1394 Trade Association, the Association will initiate action to prepare appropriate responses.

Comments on specifications and requests for interpretations should be addressed to:

Editor, 1394 Trade Association 1111 South Main Street, Suite 100 Grapevine, TX 76051, USA

1394 Trade Association Specifications are adopted by the 1394 Trade Association without regard to patents which may exist on articles, materials or processes or to other proprietary intellectual property which may exist within a specification. Adoption of a specification by the 1394 Trade Association does not assume any liability to any patent owner or any obligation whatsoever to those parties who rely on the specification documents. Readers of this document are advised to make an independent determination regarding the existence of intellectual property rights, which may be infringed by conformance to this specification.

	Support new features	

# 1. Overview

This document specifies IIDC 1394-based Digital Camera Specification for industrial use. This document describes control and status registers definition and its control procedures.

## 1.1 Purpose

The purpose of this specification provides enhanced IIDC specification for industrial cameras.

#### 1.2 Scope

This version can support 1394.b high-speed transfer. This also adds new features for industrial use and reflects "Known errata list of IIDC v1.30 specification (TB2002003)". This version is backward compatible for legacy IIDC v1.xx specifications.

## 2. References

The following standards contain provisions, which through reference in this document constitute provisions of this standard. All the standards listed are normative references. Informative references are given in Annex. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this standard are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below.

- [R1] IEEE Std 1394-1995, Standard for a High Performance Serial Bus.
- [R2] IEEE Std 1394a-2000, Standard for a High Performance Serial Bus Amendment 1
- [R3] IEEE Std 1394.b-2002, Standard for a High Performance Serial Bus High Speed Supplement
- [R4] TA1999023: IIDC 1394-based Digital Camera Specification, Version 1.30
- [R5] TB2002003: Known errata list of IIDC v1.30 specification (Supplement)
- [R6] IEEE Std 1212 Information technology- Microprocessor systems –Control and Status Registers (CSR) Architecture for microcomputer buses

## 3. Definitions

## 3.1 Conformance levels

**3.1.1 expected:** A key word used to describe the behavior of the hardware or software in the design models *assumed* by this Specification. Other hardware and software design models may also be implemented.

**3.1.2 may:** A key word that indicates flexibility of choice with *no implied preference*.

**3.1.3 shall:** A key word indicating a mandatory requirement. Designers are *required* to implement all such mandatory requirements.

**3.1.4 should:** A key word indicating flexibility of choice with a strongly preferred alternative. Equivalent to the phrase *is recommended*.

**3.1.5 reserved fields:** A set of bits within a data structure that are defined in this specification as reserved, and are not otherwise used. Implementations of this specification shall zero these fields. Future revisions of this specification, however, may define their usage.

**3.1.6 reserved values:** A set of values for a field that are defined in this specification as reserved, and are not otherwise used. Implementations of this specification shall not generate these values for the field. Future revisions of this specification, however, may define their usage.

NOTE — The IEEE is investigating whether the "may, shall, should" and possibly "expected" terms will be formally defined by IEEE. If and when this occurs, draft editors should obtain their conformance definitions from the latest IEEE style document.

## 3.2 Glossary of terms

3.2.1 byte: Eight bits of data, used as a synonym for octet.

**3.2.2 CSR Architecture:** A convenient abbreviation of the following reference (see clause 2): ISO/IEC 13213 : 1994 [ANSI/IEEE Std 1212, 1994 Edition], Information Technology—Microprocessor systems—Control and Status Register (CSR) Architecture for Microcomputer Buses.

3.2.3 quadlet: Four bytes of data.

#### 3.3 Acronyms and abbreviations

IIDC The 1394 Trade Association Instrumentation and Industrial Control Working Group, Digital Camera Sub Working Group.

IEEE The Institute of Electrical and Electronics Engineers, Inc.

# 4. Digital camera control command register

Base address for all digital camera command registers is:

Bus\_ID, Node\_ID, FFFF Fxxx xxxx (initial units space)

This address is contained in the configuration ROM in the camera unit directory.

The following sections define the entire camera CSR registers. The offset field in each of the tables is the byte offset from the above base address.

# 4.1 Camera initialize register

Offset	Name	Field	Bit	Description
000h	INITIALIZE	Initialize		If you assert this bit, Camera will re-set to initial state. This bit is self cleared, shall wait becoming "0"
		-	[131]	Reserved

Γ	0-7	8-15	16-23	24-31
i	Reserved			

Initial values	System dependent
Read values	<sup>'0'</sup> Done '1' Busy (under initialization)
Write effect	'0' no effect '1' set initial state

# 4.2 Inquiry register for video format/mode/frame rate

Each bit in the inquiry fields specifies the availability of a given feature. A value of '1' indicates that the corresponding feature is implemented; a value of '0' indicates that the corresponding feature is not implemented. The following sections define the inquiry registers.

Offset	Name	Field	Bit	Description
100h	V_FORMAT_INQ	Format_0	[0]	VGA non-compressed format.
				(Maximum 640x480)
		Format_1	[1]	Super VGA non-compressed format (1)
		Format_2	[2]	Super VGA non-compressed format (2)
		Format_x	[35]	Reserved for other format.
		Format_6	[6]	Still Image Format
		Format_7	[7]	Partial Image Size Format
		-	[831]	Reserved

#### 4.2.1 Inquiry register for video format

0-7	8-15	16-23	24-31
Format		Reserved	

Initial values	System dependent.
Read values	System dependent. Same value to Initial value.
Write effect	Ignored.

# 4.2.2 Inquiry register for video mode

Offset	Name	Field	Bit	Description
180h	V_MODE_INQ_0	Mode_0	[0]	160 X 120 YUV(4:4:4) Mode (24bit/pixel)
	(Format_0)	Mode_1	[1]	320 X 240 YUV(4:2:2) Mode (16bit/pixel)
		Mode_2	[2]	640 X 480 YUV(4:1:1) Mode (12bit/pixel)
		Mode_3	[3]	640 X 480 YUV(4:2:2) Mode (16bit/pixel)
		Mode_4	[4]	640 X 480 RGB Mode (24bit/pixel)
		Mode_5	[5]	640 X 480 Y (Mono) Mode (8bit/pixel)
		Mode_6	[6]	640 X 480 Y (Mono16) Mode (16bit/pixel)
		Mode_x	[7]	Reserved for another Mode
		-	[831]	Reserved
184h	V_MODE_INQ_1	Mode_0	[0]	800 X 600 YUV(4:2:2) Mode (16bit/pixel)
	(Format_1)	Mode_1	[1]	800 X 600 RGB Mode (24bit/pixel)
		Mode_2	[2]	800 X 600 Y (Mono) Mode (8bit/pixel)
		Mode_3	[3]	1024 X 768 YUV(4:2:2) Mode (16bit/pixel)
		Mode_4	[4]	1024 X 768 RGB Mode (24bit/pixel)
		Mode_5	[5]	1024 X 768 Y (Mono) Mode (8bit/pixel)
		Mode_6	[6]	800 X 600 Y (Mono16) Mode (16bit/pixel)
		Mode_7	[7]	1024 X 768 Y (Mono16) Mode (16bit/pixel)
		-	[831]	Reserved
188h	V_MODE_INQ_2	Mode_0	[0]	1280 X 960 YUV(4:2:2) Mode (16bit/pixel)

# 4.5 Inquiry register for feature elements

The following registers show the presence of features, modes and maximum value and minimum value for each feature. The camera, which supports multiple video, formats and video modes might change this registers. It is strongly recommended to check these registers every time the video format and/or video mode are changed. Some features may affect other features. Please see details in additional documents (the specific camera manual etc.) to determine which feature's status should be re-checked as a result.

All the fields named xxx\_Inq are bit assignments for inquiry. (0:Not available 1:Available)

61Ch	One_Shot	[0]	Except for Format_6: 1 = only one frame of video data is transmitted (Self cleared after transmission)
			For Format_6:
			1 = capture one image and save to storage device.(Self cleared)
			Ignored if ISO_EN = 1
	Multi_Shot	[1]	Except for Format_6: 1 = N frames of video data is transmitted (Self cleared after
			transmission) N is Count_Number. See below.
			For Format_6:
			<ul> <li>1 = Capture N images and save to storage device(Self cleared).</li> <li>N is image number. See below.</li> </ul>
			Ignored if ISO_EN = 1 or One_Shot = 1
	-	[215]	Reserved
	Count_Number	[1631]	Count number for Multi_shot function.
620h	Mem_Save_Ch	[03]	Write channel for Memory_Save command
			Shall be >= 0001 (0 is factory settings, which cannot be overwritten)
			(See BASIC_FUNC_INQ)
	-	[431]	Reserved
624h	Cur_Mem_Ch	[03]	When read from, returns Current Memory Channel number
			When written to, loads status, modes, and values from the specified memory channel
	-	[431]	Reserved
628h	Vmode_Error_Status	[0]	Error status of combination of Video format, mode, frame rate and
			ISO_Speed setting. 0: no error
			1: error
			This flag will be updated every time at one of the above setting is
			changed by writing new value.
			(Except for Format_6 and Format_7)
00.01	-	[131]	Reserved
62Ch	Software_Trigger	[0]	Software trigger Write:
			0: Reset software trigger
			1: Set software trigger
			(Self cleared, when Trigger Mode=0,2,4)
			Read:
			0: Ready
630h	Data_Depth	[0 7]	1: Busy Effective data depth of current image data
03011		[07]	If read value of Data_Depth is zero, shall ignore this field.
			Write:
			Ignored
			Read:
		10 0 11	Effective data depth
	-	[831]	Reserved

1	Initial values	System dependent.
	Read values	Last update
	Write effect	As indicated in table above

#### 4.6.1.1 Transfer

During ISO\_EN = 1 or One\_Shot = 1 or Multi\_Shot =1, the register value which reflects the Isochronous packet format cannot change. Writing value should be ignored. (Data transfer control priority is ISO\_EN > One\_Shot > Multi\_Shot)

#### 4.6.1.2 Data\_Depth

This set of registers describes the effective data depth of current image data. Image data should be filled from least significant bit (LSB) and odd bits should be filled with zeros. If the value of this register is zero, the camera doesn't support this feature and you shall ignore this value.

#### 4.6.2 Storage Media CSR (only for Format\_6)

Offset	Name	Field	Bit	Description
680h	Media_Status	Media_Presence	[0]	Presence of the Media. 1=presence (Read only)
		Write_Protect	[1]	1 = Write Protected, 0 = Writable
		-	[27]	Reserved
		Occupied_Rate	[815]	Percentage of occupied rate.(0x64=100d is full)
				(Read only)
		-	[1631]	Reserved
684h	Number_Of_Images	Expected_Remain	[015]	Expected number of images can store If value is 0xffff, shall ignore this field. (Read only)
		Number_Of_Images	[1631]	Number of stored images. (Read only)
688h	Media_Initialize	Initialize_Keyword	[031]	If the value that is equal to 'Initialize_Keyword' is written, media will be initialized. Initialize_Keyword = 0x46726D74 = 'Frmt'
68Ch	Image_ID for_Delete	Image_ID	[015]	Image_ID value to delete one image.
		-	[1631]	Reserved
690h	Delete_Image	Delete_Keyword	[031]	If the value that is equal to 'Delete_Keyword' is written, one image it's ID is equal to "Image_ID" in 68Ch register will be deleted. Initialize_Keyword = 0x 44656C74 = 'Delt'

#### 4.6.3 Stored Image CSR (only for Format\_6)

Offset	Name	Field	Bit	Description
6C0h	Image_Number	Image_Number	[015]	Select one of the stored images. "Image_Number" shall be less than "Number_Of_Images" in 684h register.
		-	[1631]	Reserved
6C4h	Image_Status	Write_Protect	[0]	1 = Write Protected, 0 = Writable

I		-	[17]	Reserved
		Number_Of_Quality	[815]	This value shows number of image quality level in the selected image file. It shall be more than Zero. See "Load_Image_Quality" register. (Read Only)
		Image_ID	[1531]	ID number of selected image. This is unique value in the same storage media. (Read only)
6C8h	Image_Information_Add	-	[015]	Reserved
	ress	Address_Hi	[1631]	Direct base address of the Image Information data. Upper 16 bits. (Read only)
6CCh	Image_Information_Add ress	Address_Lo	[031]	Direct base address of the Image Information data. Lower 32 bits. (Read only)
6D0h	Bytes_Of_Image_Infor mation	Total_Bytes	[031]	Total amount of bytes of Image information data. If this value is Zero, information data for selected image is not available.
6D4h	Thumbnail_Address	-	[015]	Reserved
		Address_Hi	[1631]	Direct base address of the thumbnail image data. Upper 16 bits. (Read only)
6D8h	Thumbnail_Address	Address_Lo	[031]	Direct base address of the thumbnail image data. Lower 32 bits. (Read only)
6DCh	Bytes_Of_Thumbnail	Total_Bytes	[031]	Total amount of bytes of thumbnail image data. If this value is Zero, thumbnail image of the selected image is not available. (Read only)
6E0h	Load_Image_Quality	Image_Quality	[07]	Select image quality level. 0 = whole data of the selected image file. 1 = lowest quality image data 'Image_Quality' <= 'Number_Of_Quality' Bigger value means higher quality.
6E4h	Image_Address	-	[015]	Reserved
		Address_Hi	[1631]	Direct base address of the image data. Upper 16 bits. (Read only)
6E8h	Image_Address	Address_Lo	[031]	Direct base address of the image data. Lower 32 bits. (Read only)
6ECh	Bytes_Of_Image	Total_Bytes	[031]	Total amount of bytes of the image data. If this value is Zero, image is not available.

# 4.7 Status and control register for feature

The user can control each feature through "Status and control register for feature". The controllable items are mode and value.

#### Mode:

Each CSR has three bits for mode control, ON\_OFF, One\_Push and A\_M\_Mode. A feature can have four states corresponding to the combination of mode control bits.

One_Push	ON_OFF	A_M_Mode	State
х	0 X		Off state.
~	U	Λ	Feature will be fixed value state and uncontrollable.
v	1	1	Auto control state.
^	1	I	Camera controls feature by itself continuously.
0	1	0	Manual control state.
0	I	0	User can control feature by writing value to the value field.
1			One-Push action.
(Self clear)	1	0	Camera controls feature by itself only once and return to
			Manual control state with adjusted value.

( X : don't care )

#### Value:

If ReadOut\_Inq bit of the "Inquiry register for feature elements" is one, the value field is valid and can be used for controlling feature. The user can write control value to value field only at the Manual control state. At the other states, the user can only read the value. The camera always has to show the real setting value at the value field if ReadOut\_Inq is one.

A camera, which supports multiple video, formats and video modes might change presence, capability mode, Min\_Value and Max\_Value of the feature. It is strongly recommended to check "Inquiry register for feature elements" register every time when you change the video format and/or video mode.

Offset	Name	Field	Bit	Description
800h	BRIGHTNESS	Presence_Inq	[0]	Presence of this feature
				0:N/A 1:Available
		Abs_Control	[1]	Absolute value control
				0: Control with value in the Value field
				1: Control with value in the Absolute value CSR

#### 4.7.1 Inquiry register for Absolute value CSR offset address

0-7	8-15	16-23	24-31					
Base addr	Base address of the Absolute value CSR (quadlet offset)							

"Base address of the Absolute value CSR" is the quadlet offset from the base address of initial register space.

Initial values	System dependent
Read values	System dependent (Same as initial value)
Write effect	Ignored

#### 4.7.2 Feature control error status register

Each field is an error or warning flag for the corresponding feature control register. If bit = 1, mode and/or value of the feature control register has some error or warning. If bit = 0, no error or warning. Each flag will be updated every time when corresponding feature control register is updated. It is strongly recommended to check feature register if bit = 1.

# 4.9 Video Mode CSR for Format\_7

Base address for each video mode command and status registers is:

Bus\_ID, Node\_ID, FFFF Fxxx xxxx (initial units space)

This address is contained in the Format\_7 section of the "4.2.3 Inquiry register for video frame rate and base address of the Video Mode CSR for the Partial Image Size Format". This register shall be prepared for each video mode that is Format\_7, Mode\_x.

The offect field in each of the fall	orring table is the brite o	ffeat from the chore has address
The offset field in each of the tong	owing lable is the ovie o	offset from the above base address.
The offset here in each of the follo	owing there is the offee	moet mom the above base address.

Offset	Name	Field	Bit	Description	
000h	MAX_IMAGE_SIZE_INQ	Hmax	[015]	Maximum Horizontal pixel number

					D=255
		-	[831]	Reserved	
05Ch : 07Bh	Reserved				
07Ch	VALUE_SETTING	Presence	[0]	If this bit is one, "Setting_1", "ErrorFlag_1" "ErrorFlag_2" fields are valid. This bit is re only.	

Setting_1	[1]	If writing "1" to this bit, IMAGE_POSITION, IMAGE_SIZE, COLOR_CODING_ID and ISO_Speed register value will be reflected in PIXEL_NUMBER_INQ, TOTAL_BYTES_HI_INQ, TOTAL_BYTES_LO_INQ, PACKET_PARA_INQ and BYTE_PER_PACKET register. This bit is self-cleared. The user should wait for it to become 0 then checking ErrorFlag_1 is zero before using the value in the PIXEL_NUMBER_INQ, TOTAL_BYTES_HI_INQ, TOTAL_BYTES_LO_INQ, PACKET_PARA_INQ and BYTE_PER_PACKET register
ErrorFlag_1	[27] [8]	Reserved Combination of the values of IMAGE_POSITION, IMAGE_SIZE, COLOR_CODING_ID and ISO_Speed register is not acceptable. 1: error 0: no error This flag will be updated every time when Setting_1 bit returns to "0" from "1". BytePerPacket value is not acceptable.
Error-lag_2	[9] [1031]	BytePerPacket value is not acceptable. 1: error 0: no error Reserved

During  $ISO_EN = 1$  or  $One_Shot = 1$  or  $Multi_Shot = 1$ , the register value which reflects the Isochronous packet format cannot change. Writing value should be ignored.

#### 4.9.1 MAX\_IMAGE\_SIZE\_INQ register

This register is an inquiry register for maximum image size.

0-7	8-15	16-23	24-31
Hmax (pixels)		Vmax	(pixels)

Initial values	System dependent
Read values	System dependent (Same as initial value)
Write effect	Ignored

### 4.9.2 UNIT\_SIZE\_INQ and UNIT\_POSITION\_INQ register

This register is an inquiry register for unit size.

Hmax = Hunit \* n = Hposunit\*n3 (n, n3 is integer)

Vmax = Vunit \* m = Vposunit\*m3 (m, m3 is integer)

If read value of Hposunit is 0, Hposunit = Hunit for compatibility with Rev 1.20.

If read value of Vposunit is 0, Vposunit = Vunit for compatibility with Rev 1.20.

Copyright © 2004, 1394 Trade Association. All rights reserved.

UNIT\_SIZE\_INQ

Hunit (pixels)		Vunit (	pixels)

#### UNIT\_POSITION\_INQ

0-7	8-15	16-23	24-31
Hposunit (pixels)		Vposuni	t (pixels)

Initial values	System dependent
Read values	System dependent (Same as initial value)
Write effect	Ignored

# 4.9.3 IMAGE\_POSITION and IMAGE\_SIZE register

These registers determine an area of required data. All the data shall be as follows:

Left = Hposunit \* n1

Top = Vposunit \* m1

Width = Hunit \* n2

Height = Vunit \* m2 (n1, n2, m1, m2 are integer)

Left + Width <= Hmax

Top + Height <= Vmax

0-7	8-15	16-23	24-31
Left		Тор	
0-7	8-15	16-23	24-31
Width		Height	

1	Initial values	System dependent
	Read values	Last update value
	Write effect	Stored

#### 4.9.4 COLOR\_CODING\_ID and COLOR\_CODING\_INQ registers

COLOR\_CODING\_INQ register describes available color-coding capability of the system. Each coding scheme has its own ID number. Required color-coding scheme shall be set to COLOR\_CODING\_ID register as the ID number.

COLOR\_CODING\_ID register

0-7	8-15	16-23	24-31
Coding_ID		Reserved	

1	Initial values	System dependent
	Read values	Last update value
	Write effect	Stored

COLOR\_CODING\_INQ registers

0-7	8-15	16-23	24-31
Bit assignment is described in the table above			

Ī	Initial values	System dependent
	Read values	System dependent (Same as initial value)
	Write effect	Ignored

#### 4.9.5 PIXEL\_NUMBER\_INQ and TOTAL\_BYTE\_INQ registers

PIXEL\_NUMBER\_INQ register includes total pixel number of required image area.

TOTAL\_BYTE\_INQ register includes total data amount value of required image area as the bytes. If Presence bit in the VALUE\_SETTING register is zero, values of these registers will be updated by writing new value to IMAGE\_POSITION, IMAGE\_SIZE and COLOR\_CODING\_ID registers. If Presence bit in the VALUE\_SETTING register is one, values of these registers will be updated by writing one to the Setting\_1 bit in the VALUE\_SETTING register. If ErrorFlag\_1 bit is zero after Setting\_1 bit returns to zero, values of these registers are valid.

PacketPerFrame \* BytePerPacket indicates whole data size include padding data.

Caution: TotalByte indicates effective image data size. It doesn't include padding data.

PIXEL\_NUMBER\_INQ register

# 4.9.6 PACKET\_PARA\_INQ and BYTE\_PER\_PACKET register

MaxBytePerPacket describes maximum packet size for one Isochronous packet. UnitBytePerPacket is the unit for Isochronous packet size.

RecBytePerPacket describes recommended packet size for one Isochronous packet. If RecBytePerPacket is zero, you shall ignore this field.

If Presence bit in the VALUE\_SETTING register is zero, values of these fields will be updated by writing new value to IMAGE\_POSITION, IMAGE\_SIZE and COLOR\_CODING\_ID registers with the value of ISO\_Speed register.

At first, ISO\_Speed register shall be written. Then IMAGE\_POSITION, IMAGE\_SIZE and COLOR\_CODING\_ID registers should be updated.

If Presence bit in the VALUE\_SETTING register is one, values of these fields will be updated by writing one to the Setting\_1 bit in the VALUE\_SETTING register. If ErrorFlag\_1 bit is zero after Setting\_1 bit returns to zero, values of these fields are valid.

BytePerPacket value determines real packet size and transmission speed for one frame image. BytePerPacket value shall keep the following condition.

BytePerPacket = UnitBytePerPacket \* n (n is integer) BytePerPacket <= MaxBytePerPacket

#### PACKET\_PARA\_INQ

0-7	8-15	16-23	24-31
UnitByteF	PerPacket	MaxByte	PerPacket

Write effect	Stored

#### 4.9.7 PACKET\_PER\_FRAME\_INQ register

If BytePerPacket \* n != BytePerFrame (n is integer), you shall use padding. The PacketPerFrame value is a number of packets per one frame. This register will be updated after BytePerPacket is written. If the value is zero, the host shall calculate PacketPerFrame itself. PacketPerFrame can be calculated by "TOTAL\_BYTES\_HI\_INQ, TOTAL\_BYTES\_LO\_INQ" and "BYTE\_PER\_PACKET". Total number of bytes of transmission data per one frame = BytePerPacket \* PacketPerFrame

Number of bytes of padding = BytePerPacket \* PacketPerFrame - BytePerFrame

Receiver shall ignore above padding data in the last packet of each frame.

The host program shall calculate PacketPerFrame as follows.

if( TotalByte % BytePerPacket == 0) {

PacketPerFrame = TotalByte / BytePerPacket;

} else {

PacketPerFrame = TotalByte / BytePerPacket + 1;

}

0-7	8-15	16-23	24-31
	PacketP	erFrame	

1	Initial values	System dependent
	Read values	Last update value
	Write effect	Ignored

#### 4.9.8 VALUE\_SETTING register

If Presence bit is one, this register is available and valid. Purpose of Setting\_1 bit is for updating TOTAL\_BYTES\_HI\_INQ, TOTAL\_BYTES\_LO\_INQ, PACKET\_PARA\_INQ and BYTE\_PER\_PACKET register. If one of the value in the IMAGE\_POSITION, IMAGE\_SIZE, COLOR\_CODING\_ID and ISO\_Speed register is changed, Setting\_1 bit shall be set "1".

ErrorFlag\_1 field will be updated when Setting\_1 bit returns to "0". If ErrorFlag\_1 field is zero, values of TOTAL\_BYTES\_HI\_INQ, TOTAL\_BYTES\_LO\_INQ, PACKET\_PARA\_INQ and BYTE\_PER\_PACKET register are valid.

After the BytePerPacket value is written, the ErrorFlag\_2 field will be updated. If ErrorFlag\_2 is zero, Isochronous transmission can be started without any problem.

#### 4.9.9 FRAME\_INTERVAL\_INQ register

This describes status of frame interval of current camera conditions including exposure time. Reciprocal value of this is frame rate of the camera. If value of this register is zero, camera can't report this value you shall ignore this value. Frame\_Interval is defined by sec in IEEE1394/REAL\*4 floating-point value.

# 4.10 CSRs Advanced Features

These CSRs are for vendor unique features. The vendor shall prepare CSRs for these additional features and write the base address of these CSRs at 480h as a quadlet offset value from the base address of initial register space.

The first two quadlets are "Access Control Register"(ACR). The user has to write "Feature\_ID" to ACR to unlock "CSRs Advanced Features". Each model that implements "CSRs Advanced Features" shall have "Feature\_ID". "Feature\_ID" is advanced feature set unique value and consists of 48bits.

The remaining structure of this area has to be determined by vendor.

The user can determine Time\_Out value with the unlock operation. Time\_Out value consists of 12 bits and the unit is millisecond. (Maximum 4.095 second) If the user does not access "CSRs Advanced Features" within Time\_Out value, the unlock operation will be canceled and ACR will return to its initial state. If the user access "CSRs Advanced Features" within Time\_Out value, Time\_out will be refreshed. If this value is "0", Time\_Out doesn't occur. (Can access any vendor unique register anytime.)

1) After unlocked, if response of reading Bus\_ID+Node\_ID field is user node's ID, and only unlocking node can access "CSRs Advanced Features" within time-out. (Node locked mode)

2) After unlocked, if response of reading Bus\_ID+Node\_ID field is camera's own ID, and not only unlocking node but also other nodes also can access "CSRs Advanced Features" within time-out. (Unlocked mode)

If bus reset occurs, ACR will be initialized.

_		
	Initial values	All ones (0xfffffffffffffff)
	Read values	Last update value
	Write effect	If the upper 48 bits of written value is equal to "Feature_ID", store source or target (depend on lock mode) Bus_ID + Node_ID (16 bits) value to upper 16bits area. Also, Time_Out value and lower 12 bits value are stored. If Time_Out value= "0", no time out occurs. The other bits will be one. If upper 48 bits of written value is not equal to "Feature_ID", write action is ignored and all bits will be one.
	Bus Reset	All one

# Feature\_ID

0-7	8-15	16-23	24-31	32-39	40-47	
Company_ID			Advanced feature set unique value			

Each company has to manage lower 3 bytes value to keep advanced feature set uniqueness.

# 4.11 Optional Function CSR

# 4.11.1 PIO Control Function

These CSRs are for parallel input/output (PIO) control function. PIO is a general input and output parallel port via camera.

Offset	Name	Field	Bit	Description
000h	PIO_Output	Output_Port	[031]	General purpose PIO output
004h	PIO_Input	Input_Port	[031]	General purpose PIO input

# 4.11.2 SIO Control Function

These CSRs are for serial input/output (SIO) control function. SIO is a general input and output serial port via camera.

#### 4.11.2.1 Serial Input Transaction

[1] Read the valid data size of current receive buffer RBUF\_ST\_CNT or RDRD flag.

[2] Write the input data length to RBUF\_ST\_CNT.

[3] Read received characters from SIO\_Data\_Register.

[4] To input more characters, repeat from step 1.

Note) Overrun read data value of the receive buffer are undefined.

# 4.11.2.2 Serial Output Transaction

[1] Read the available data space of current transmit buffer TBUF\_ST\_CNT or TDRD flag.

- [2] Write characters to SIO\_Data\_Register
- [3] Write the valid output data length to TBUF\_ST\_CNT to start transmit

[4] To output more characters, repeat from step 1.

Note 1) Padding data in the transmit buffer is discarded after a successful output transaction. (If OUTPUT\_LENGTH=1 and write a quadlet (4-byte) data to SERIAL\_DATA\_BUFFER, only first char is transmitted and remaining 3 chars are discarded from buffer).

Note 2) Transmitted data may be discarded from buffer.

# 4.12 Absolute value CSR for Feature elements

Absolute value CSR is for absolute value control for each feature elements if available. Each CSR consists of three quadlet. Vendor shall prepare CSR and write base address of this CSR at "Inquiry register for Absolute value CSR offset address" as a quadlet offset value from the base address of initial register space.

Units of all elements are predefined. Please see appendix B for details.

All value shall be IEEE/REAL\*4 Floating-point format.

Offset	Name	Field	Bit	Description
000h	Absolute value	Min_Value	[031]	Minimum value for this feature control
004h		Max_Value	[031]	Maximum value for this feature control
008h		Value	[031]	Absolute control value

0-7	8-15	16-23	24-31			
Floating-point value with IEEE/REAL*4 format						

IEEE/REAL\*4 Floating-Point Value Notation:

Sign (S)	Exponent (exp)	Mantissa (m)
1bit	8bit	23bit

For Min\_Value, Max\_Value

# 6. Serial bus management

This chapter describes the camera behavior on a given Serial Bus. (IEEE 1394 Digital Camera is in accordance with IEEE standard 1212-1991.)

#### 6.1 Bus Management

The camera compliant with this specification is a peripheral for a personal computer or workstation. Another node on the IEEE 1394 bus, such as a computer, acts as the camera controller.

In order for the camera to perform any action, the camera controller shall access the camera control registers, as described in this standard. A camera, which is compliant with this protocol standard, is a passive device. It initiates no actions of its own.

The camera is neither Isochronous manager capable nor full bus manager capable. The camera is also not cycle master capable. The contents of the self\_ID packet generated by the camera, and the contents of camera configuration ROM shall accurately reflect this level of capability.

In order for the camera to perform any action, it shall be connected to other IEEE 1394 nodes. At a minimum, there shall be a cycle master capable node and an Isochronous manager capable node. In addition, there shall be some node that is running application software that implements the protocol described in this standard. Note that all of these capabilities could reside in a single node.

The camera controller is responsible for the following activities related to camera operation:

Force a cycle master capable node to be the root

Start cycle master operation

Initialize the camera control registers for a desired video mode, frame rate, etc.

Allocate Isochronous resources needed by the camera (Isochronous channel number and bandwidth, as needed for the selected video mode)

Program the Isochronous channel number and transmit speed into the camera control registers

Instruct the camera to start sourcing Isochronous video data

The camera continues sourcing Isochronous video data until the camera controller instructs the camera to stop. If a bus reset occurs during camera operation, the camera continues sourcing Isochronous data immediately after the bus reset.

# 6.2 Asynchronous Transfer Capabilities

The camera compliant with this specification shall be capable of sending and receiving the asynchronous packets with a payload of up to the maximum payload size of "mac\_rec" field of the Configuration ROM.

# 6.3 Isochronous Transfer Capabilities

The camera compliant with this specification is capable of being an Isochronous talker. The camera is not capable of listening to a channel of Isochronous data.

# 6.4 IEEE 1394 Specific Address Space

The camera compliant with this specification shall be compliant with the IEEE 1394 and IEEE 1212 standards.

The following sections define all CSR and ROM locations that the camera shall implement. All information in these sections is intended to comply with the IEEE 1394 standard. Where discrepancies arise, the IEEE 1394 standard shall prevail.

All address-offset locations in these sections are with respect to a base address of:

FFFF F000 0000h

#### 6.4.1 Implemented CSR's

The digital camera implements the following core CSR's, as required by the IEEE 1394 standard:

Offset	0-7	8-15	16-23	24-31		
0000h	STATE_CLEAR					
0004h	STATE_SET					
0008h	NODE_IDS					
000Ch	RESET_START					
0010h						
0014h						
0018h	SPLIT_TIMEOUT_HI					
001Ch	SPLIT_TIMEOUT_LO					

# Core CSR's

The digital camera implements the following IEEE 1394 Serial Bus dependent CSR's:

Offset	0-7	8-15	16-23	24-31	
0200h	CYCLE_TIME				
0204h					
0208h					
020Ch					
0210h	BUSY_TIMEOUT				

# Serial Bus Dependent CSR's

#### 6.4.2 Configuration ROM

IEEE 1394 Digital Camera implements the Configuration ROM as defined in IEEE standard 1212-1991, IEEE standard 1394-1995 and IEEE standard 1394a-2000. These assignments are only an example. Key code can describe the roll of registers so some of registers' order is not mandatory. Please see IEEE std 1212 specification in detail.

unit\_sw\_version = 0x000102 (for 1394 based Digital Camera specification version 1.30)

Copyright © 2004, 1394 Trade Association. All rights reserved.

History:

- unit\_sw\_version = 0x000101 (for 1394 based Digital Camera specification version 1.20)

- unit\_sw\_version = 0x000100 (for 1394 based Digital Camera specification version 1.04 )

# Unit Dependent Directory

Where:

command\_regs\_base is the quadlet offset from the base address of initial register space of the base address of the command registers defined in section 1 of this standard.

vendor\_name\_leaf specifies the number of quadlets from the address of the vendor\_name\_leaf entry to the address of the vendor\_name leaf containing an ASCII representation of the vendor name of this node.

model\_name\_leaf specifies the number of quadlets from the address of the model\_name\_leaf entry to the address of the model\_name leaf containing an ASCII representation of the model name of this node.

Unit\_sub\_sw\_version\_info specifies the sub version information of this unit.

-unit\_sub\_sw\_version = 0x000000h or unspecified for IIDC v1.30 -unit\_sub\_sw\_version = 0x000010h for IIDC v1.31 (This Version) :

-unit\_sub\_sw\_version = 0x000090h for IIDC v1.39

Vendor\_unique\_info\_x can specifies the vendor unique information, if need.

#### 6.4.3 Format of Vendor Name and Model Name Leaves

The unit dependent directory may contain pointers to information leaves that contain the ASCII name of the vendor and model name for this node. The format of these leaves is shown in the following table:

	Offset	0-7	8-15	16-23	24-31
	0000h	leaf_length		CRC	
	0004h	00h	00 0000h

	n+Ah	char_n-2	Char_n-1	NUL	NUL

# Vendor Name/Model Name Leaves

# Annexes

# Annex A: Feature definition and specification

# A.1 Brightness Control

Black level of the picture.

#### Off state:

Brightness level will be fixed value.

#### Auto control state:

Camera controls brightness level automatically by itself continuously.

#### Manual control state:

Camera controls brightness level manually by writing value to value-field.

#### **One-Push action:**

Camera controls brightness level automatically by itself only once and returns to Manual mode with adjusted value.

# A.2 Auto Exposure Control

This feature is similar to "Contrast control".

#### Off state:

Exposure will be controlled manually using "Gain", "Iris" and/or "Shutter" features.

#### Auto control state:

Camera controls reference level automatically by itself continuously

#### Manual control state:

Camera controls exposure level automatically, but user can change reference level by writing value to "Auto\_Exposure" register.

#### **One-Push action:**

Camera controls reference level automatically by itself only once and returns to Manual control state with adjusted value.

# A.3 Sharpness Control

Sharpness of the picture.

#### Off state:

Sharpness level will be fixed value.

#### Auto control state:

Camera controls sharpness level automatically by itself continuously.

#### Manual control state:

Camera controls sharpness level manually by writing value to value-field.

#### **One-Push action:**

Camera controls sharpness level automatically by itself only once and returns to Manual control state with adjusted value.

# A.4 White Balance Control

Adjustment of the white color of the picture.

At the YUV video mode, controlled by U value and V value.

At the RGB video mode, controlled by B value and R value.

#### **Off state:**

White balance will be fixed value.

#### Auto control state:

Camera controls white balance automatically by itself continuously.

#### Manual control state:

Camera controls white balance manually by writing value to value-field.

#### **One-Push action:**

Camera controls white balance automatically by itself only once and returns to Manual control state with adjusted value.

# A.5 Hue Control

Color phase of the picture.

#### Off state:

Hue will be fixed value.

Page 70

#### Auto control state:

Camera controls hue automatically by itself continuously.

#### Manual control state:

Camera controls hue manually by writing value to value-field.

#### **One-Push action:**

Camera controls hue automatically by itself only once and returns to Manual control state with adjusted value.

#### A.6 Saturation Control

Color saturation of the picture.

#### Off state:

Saturation level will be fixed value.

#### Auto control state:

Camera controls saturation level automatically by itself continuously.

#### Manual control state:

Camera controls saturation level manually by writing value to value-field.

#### **One-Push action:**

Camera controls saturation level automatically by itself only once and returns to Manual control state with adjusted value.

### A.7 Gamma Control

Define the function between incoming light level and output picture level.

y = f(x)

y : output picture level x : incoming light level

#### Off state:

Gamma will be fixed value.

#### Auto control state:

Camera controls gamma automatically by itself continuously.

#### Manual control state:

Camera controls gamma manually by writing value to value-field.

#### **One-Push action:**

Camera controls gamma automatically by itself only once and returns to Manual control state with adjusted value.

#### A.8 Shutter Control

Integration time of the incoming light.

#### Off state:

Integration time will be fixed value.

#### Auto control state:

Camera controls integration time automatically by itself continuously.

#### Manual control state:

Camera controls integration time manually by writing value to value-field.

#### **One-Push action:**

Camera controls integration time automatically by itself only once and returns to Manual control state with adjusted value.

#### A.9 Gain Control

Camera circuits gain control.

#### Off state:

Gain level will be fixed value.

#### Auto control state:

Camera controls gain level automatically by itself continuously.

#### Manual control state:

Camera controls gain level manually by writing value to value-field.

#### **One-Push action:**

Camera controls gain level automatically by itself only once and returns to Manual control state with adjusted value.

#### A.10 Iris Control

TRADE ASSOCIATION

Mechanical lens iris control.

## Off state:

Iris will be fixed value.

### Auto control state:

Camera controls iris automatically by itself continuously.

### Manual control state:

Camera controls iris manually by writing value to value-field.

### **One-Push action:**

Camera controls iris automatically by itself only once and returns to Manual control state with adjusted value.

# A.11 Focus Control

Lens focus control.

#### Off state:

Focus will be fixed value.

#### Auto control state:

Camera controls focus automatically by itself continuously.

#### Manual control state:

Camera controls focus manually by writing value to value-field.

#### **One-Push action:**

Camera controls focus automatically by itself only once and returns to Manual control state with adjusted value.

# A.12 Temperature Control

Getting the sensor temperature inside of the camera and/or controlling temperature.

## Off state:

Camera stops temperature control.

#### Auto control state:

Camera controls temperature by itself aims to "Target\_Temperature" continuously.

Copyright © 2004, 1394 Trade Association. All rights reserved.

User can get temperature at the present time from "Temperature" value.

#### Manual control state:

In this mode, camera controls temperature by itself. But "Target\_Temperature" value will be ignored. User can only get temperature at the present time from "Temperature" value.

### **One-Push action:**

Camera controls temperature by itself aims to "Target\_Temperature" value only once. User can get temperature at the present time from "Temperature" value.

# A.13 Trigger Control

If this feature is turned on, trigger function will work.

## Off state:

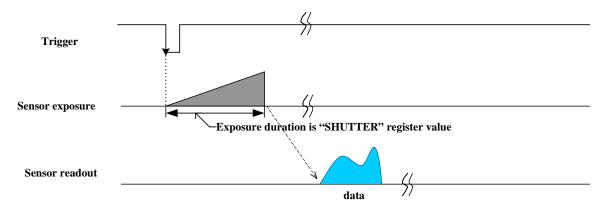

Trigger input is ignored.

#### **Trigger mode definition**

In the following explanation, trigger input is in case of "Low Active". (Trigger\_Polarity = 0)

#### **Trigger mode 0:**

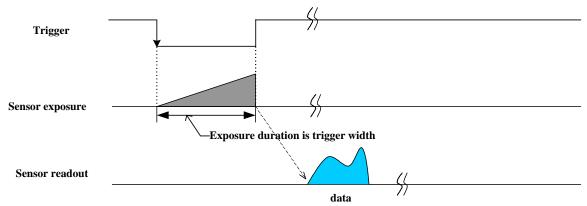

Camera starts integration of the incoming light from external trigger input falling edge. Integration time is described in "Shutter" register. No parameter is needed.

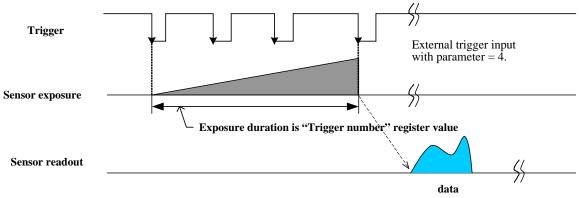

# Trigger mode 1:

Camera starts integration of the incoming light from external trigger input falling edge. Integration time is equal to low state time of the external trigger input. No parameter is needed.

## **Trigger mode 2:**

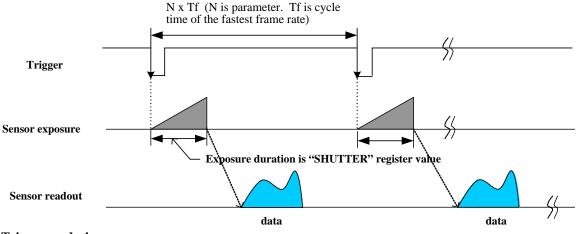

Camera starts integration of incoming light from first external trigger input falling edge. At the N-th (parameter) external trigger input falling edge, integration will be stopped. Parameter is required and shall be two or more. (N  $\geq$  2)

## Trigger mode 3:

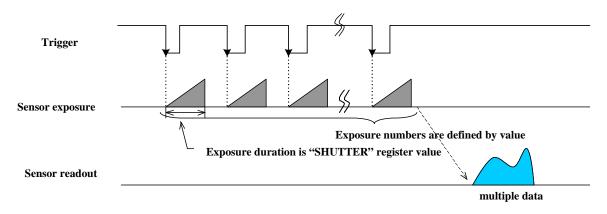

This is an internal trigger mode. Camera will issue trigger internally and cycle time is N times (parameter) of the cycle time of fastest frame rate. Integration time of incoming light is described in "Shutter" register. Parameter is required and shall be one or more.  $(N \ge 1)$ 

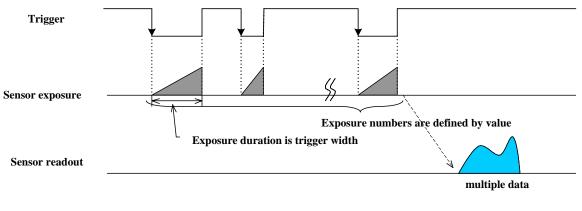

## Trigger mode 4:

This mode is "multiple shutter preset mode". Camera starts integration of incoming light from first external trigger input falling edge and exposes incoming light at shutter time. Repeat this sequence the N-th (parameter) external trigger input falling edge then finish integration. Parameter is required and shall be one or more. (N  $\geq 1$ )

#### Trigger mode 5:

This mode is "multiple shutter pulse width mode". Camera starts integration of incoming light from first external trigger input falling edge and exposes incoming light until trigger is inactive. Repeat this sequence the N-th (parameter) external trigger input falling edge then finish integration. Parameter is required and shall be one or more. (N  $\geq$  1)

## Trigger mode 14,15:

These trigger modes are vendor unique. Camera vendor can implement vendor unique trigger mode here.

# A.14 Trigger Delay Control

Add internal delay of trigger signal.

#### Off state:

No additional internal trigger delay.

# A.15 White Shading Compensation

Adjust white shading compensation.

#### Off state:

White shading compensation level will be fixed value.

#### Auto control state:

Camera controls white shading compensation level automatically by itself continuously.

#### Manual control state:

Camera controls white shading compensation level by writing value to value-field.

#### One push action:

Camera controls white shading compensation level automatically by itself only once and returns to Manual control state with adjusted value.

#### Value explanation:

#### **R\_value:**

Red channel compensation value. Write the value in AUTO mode, this field is ignored. If "ReadOut" capability is not available, read value has no meaning

## G\_value:

Green channel compensation value. Write the value in AUTO mode, this field is ignored. If "ReadOut" capability is not available, read value has no meaning

# **B\_value:**

Blue channel compensation value. Write the value in AUTO mode, this field is ignored. If "ReadOut" capability is not available, read value has no meaning

# A.16 Frame Rate Prioritize Control

The frame interval is fixed by the frame rate value. When this feature is ON, exposure time is limited by frame rate value dynamically. The valid minimum and maximum shutter feature values should be checked when the frame rate is changed. If shutter (exposure) value is longer, it may be forced to change maximum value automatically. The available frame rate range depends on the current video format and/or video mode and the camera implementation. It is strongly recommended to check minimum and maximum value after video format and/or video mode have been changed.

#### **Off state:**

Frame interval is controlled by shutter value.

#### Auto control state:

Camera controls frame rate automatically by itself continuously.

#### Manual control state:

Camera controls frame interval based on frame rate value.

#### **Example of usage:**

Camera is in 640x480 Y8 mode at 30Hz (Cur\_V\_Frm\_Rate=4)

Assume units of Value are 1/60000s (13.333us)

Frame\_Rate\_Inq: Presence\_Inq = 1 Abs\_Ctrl\_Inq = 0 One\_Push\_Inq = 0 On/Off\_Inq = 1 ReadOut\_Inq = 1 Auto\_Inq = 0 Min\_Value = 1875 Max\_Value = 4000

Frame_Rate_Inq	On_Off	Value	Frame_Rate
800007D0h	0	2000	Depends on shutter
			time
82000753h	1	1875	32Hz
820007D0h	1	2000	30Hz
820007D2h	1	2002	29.97Hz(NTSC)
82000960h	1	2400	25Hz
82000EA6h	1	3750	16Hz
82000FA0h	1	4000	15Hz

# A.17 Zoom Control

Lens zoom control.

#### Off state:

Zoom will be fixed value.

#### Auto control state:

Camera controls zoom automatically by itself continuously.

#### Manual control state:

Camera controls zoom manually by writing value to value-field.

#### **One-Push action:**

Camera controls zoom automatically by itself only once and returns to Manual control state with adjusted value.

# A.18 Pan Control

Camera pan control.

#### Off state:

Pan will be fixed value.

#### Auto control state:

Camera controls pan automatically by itself continuously.

#### Manual control state:

Camera controls pan manually by writing value to value-field.

#### **One-Push action:**

Camera controls pan automatically by itself only once and returns to Manual control state with adjusted value.

# A.19 Tilt Control

Camera tilt control.

## Off state:

Tilt will be fixed value.

### Auto control state:

Camera controls tilt automatically by itself continuously.

#### Manual control state:

Camera controls tilt manually by writing value to value-field.

#### **One-Push action:**

Camera controls tilt automatically by itself only once and returns to Manual control state with adjusted value.

# A.20 Optical filter Control

Changing optical filter of camera lens function.

## Off state:

Optical filter will be fixed value.

#### Auto control state:

Camera controls optical filter automatically by itself continuously.

#### Manual control state:

Camera controls optical filter manually by writing value to value-field.

#### **One-Push action:**

Camera controls optical filter automatically by itself only once and returns to Manual control state with adjusted value.

# Annex B: Unit of value for Absolute value control

The following tables describe unit of the value for absolute value control for each feature element.

Meaning of Value type:

Absolute: Value is absolute value.

Relative: Value is absolute value but reference point is system dependent.

# **B.1** Feature elements High

Feature element name	Function	Unit	Reference point	Value type
Brightness	Black level offset	%		Absolute
Auto Exposure	Auto Exposure	EV	0	Relative
White Balance	White Balance	K		Absolute
Hue	Hue	deg	0	Relative
Saturation	Saturation	%	100	Relative
Shutter	Integration time	S		Absolute
Gain	Circuit gain	dB	0	Relative
Iris	Iris	F		Absolute
Focus	Focus	m		Absolute
Trigger	External Trigger	times		Absolute
Trigger Delay	Internal Trigger Delay	S	0	Absolute
Frame_Rate	Frame rate	fps	-	Absolute

Definitions for other feature elements, which are not listed above, will be defined in the future.

# **B.2** Feature elements Low

Feature element	Function	Unit	Reference point	Туре
Zoom	Zoom	power	1 (Wide end)	Relative
Pan	Pan	deg	0	Relative
Tilt	Tilt	deg	0	Relative

Definitions for other feature elements, which are not listed above, will be defined in the future.

- EV: exposure value
- K: kelvin
- deg: degree
- s: second
- dB: decibel
- F: F number
- m: meter

## fps: frame per second

For the feature of "Hue", + means counterclockwise, - means clockwise on the vector scope.

For the feature of "Pan", + means turning to clockwise, - means turning to counterclockwise.

For the feature of "Tilt", + means turning to upward, - means turning to downward.

# Annex C: Functional conformance test

This section indicates minimum required functional conformance test procedure for the IIDC v1.31 camera and shows the check sheet example.

# C.1 Test Procedure

#### C.1.1 Test 1. Read Configuration ROM

Process:Requester device (PC) reads the configuration ROM of Responder device (Camera).Check Point:Check the listed values are same as the Responder's defined value.

#### C.1.2 Test 2. Read Current Camera Status

Process:	Requester device reads status register of camera
Check Point:	Check current camera status for video format/mode/frame and ISO transfer status.

#### C.1.3 Test 3. Read Inquiry Register for Format/Mode/Frame Rate

Process:	Requester device reads inquiry register of camera
Check Point:	Check current camera implementing state for current video format/mode/frame.

#### C.1.4 Test 4. Read Feature Element Register

Process:Requester device reads inquiry feature element register of cameraCheck Point:Check current camera status for each implemented feature.

# C.1.5 Test 5. Control Features

Process:Requester device controls each feature of cameraCheck Point:Check current camera status for each controlled feature.

#### C.1.6 Test 6. Read Image Transfer Format (Only format\_7)

Process:Requester device reads CSR for format\_7Check Point:Check current image transfer format and transfer parameter of the camera.

#### C.1.7 Test 7. Isochrounous Data Transfer

Process:Requester sets isochronous image data transfer bit and get image data from the camera.Check Point:Check isochronous data transfer sequence and received data reasonability

# C.2 Check Sheet Example

Attached IIDC functional conformances check sheets covers minimum requirement; this includes device compatibility of IIDC v.1.31 compliant device and ability of control, image capturing and so on. The testers do these tests according to the check sheet and write the result as followings.

Mark	Meaning	Description
Р	Pass	Test is complete without problem.
F	Fail	Test cannot be completed with some problem. In this case, the
		problems should be written in the space of "Remark".
NA	Not available	Test cannot be done since the function is not available.
